We examine the relationship between speed and stopping distance using a linear regression model: $Y = \beta_0 + \beta_1 x + \epsilon$.

```
> par(mar = c(4, 4, 1, 1), mgp = c(2, 1, 0), cex = 0.8)
> plot(cars, pch = 20, col = 'darkgray')
> fit <- lm(dist ~ speed, data = cars)
> abline(fit, lwd = 2)
```

The slope of a simple linear regression is 3.93240875912408.
